STOP REPEATING YOURSELF TO CHATGPT AND CLAUDE

# Make AI sound like you

Write your rules once in a small text file. Reuse them everywhere. Get the same tone, style, and format every time, without explaining it again and again.

**FOR**
Total beginners. Zero coding, zero setup, zero jargon.

**YOU MAKE**
Tiny rule files for email, captions, clients, and more.

**YOU GET**
AI that writes in your voice on the first try.

A practical, come back to it guide.
Read one page, make one file,
then reuse it forever.

DM "RULES"

READ ME FIRST

# How to use this guide

This is a workbook, not a blog post. The goal is simple. By the last page you can make your own rule files for your own work, starting from zero knowledge.

**ONE IDEA PER PAGE**

Every page teaches one small thing and then stops. Do not rush. Read it, try it, move on.

**COPY BOXES**

When you see a box that looks like code, you can copy what is inside it and paste it straight into ChatGPT or Claude.

**DO THIS NOW**

The coral boxes are small actions. If you actually do them, this guide will click much faster.

**WHAT YOU SHOULD SEE**

```
The green boxes show you
roughly what good output
looks like, so you know
you did it right.
```

**Plain English and Hinglish are both fine.** You do not need fancy words to write rules. If you can text a friend, you can write a rule file. Simple beats clever here.

**DO THIS NOW** Pick one task you keep asking AI to do. Emails, captions, client replies, anything. Keep it in your head. By the end you will build a rule file for exactly that.

WHY THIS EXISTS

# AI does not remember your style

You tell ChatGPT once: do not use em dashes, keep it short, sound human. It listens that one time. Next chat, it forgets and writes the same AI looking lines again.

**RANDOM CHAT**

You re explain your style every single time. AI forgets your rules the moment you open a new chat. You keep fixing the same mistakes.

**SAVED RULE FILE**

You write the rules once. You hand the same file to AI before any task. It follows the same rules every time, in every chat.

**AI LOOKING SIGNS YOU MAY WANT TO KILL**

- Too many em dashes and over polished lines.
- Corporate filler like **"I hope this email finds you well."**
- Long paragraphs when you wanted short, punchy lines.
- Generic advice instead of a clear, specific answer.

> **Simple truth.** AI is powerful, but a random chat is not a system. A saved rule file turns your repeated instructions into a system you can reuse forever.

THE WHOLE IDEA

# One file. Same output. Every time.

A rule file is a short text file that holds your instructions. You write it once. Then you give it to any AI before a task, and it writes the way you want, the first time.

`write rules once` → `give to AI` → `paste or upload` → `same style every time`

### 1. WRITE

Put your style, rules, and format into one small file. Plain English is enough.

### 2. GIVE

Paste it or upload it into ChatGPT, Claude, or any AI before the task.

### 3. REUSE

Use the same file next week, next month, in any new chat. No re explaining.

**DO THIS NOW** Do not worry about how to make the file yet. Just hold this picture in your head: write once, hand it over, reuse forever. The next pages show every step slowly.

BY THE END OF THIS GUIDE

# What you will be able to do

No coding. No paid tools. Just a text file and clear rules. Here is exactly what you will walk away knowing how to do.

### 1 Understand the basics

What a plain text file is, what markdown is, and why AI forgets your style.

### 2 Create a file anywhere

Make a real rule file on Windows, Mac, your phone, or VS Code, step by step.

### 3 Write rules that work

Use a simple 6 part formula so AI actually follows what you wrote.

### 4 Use it everywhere

ChatGPT, Claude, Claude Code, Cursor. From pasting once to fully automatic.

### 5 Start from templates

Ready files for email, captions, reels, and client messages. Copy and tweak.

### 6 Improve over time

Turn every bad AI output into one new rule, so the file keeps getting better.

PART 01

# The absolute basics

The boring but essential stuff nobody explains. What a text file is, what markdown is, and how to make your first file without it saving wrong. Skip nothing here.

06 What a text file really is

07 The bit after the dot

08 What markdown actually is

09 The only symbols you need

10 Do you even need a file

11 Make your first file (Windows)

12 Mac, phone, and VS Code

13 When the file goes wrong

START FROM ZERO

# What a text file really is

You already know Word docs and Google Docs. A rule file is simpler than both. It is a plain text file, which means only letters and symbols. No fonts, no colours, no images, nothing hidden.

**WORD / GOOGLE DOC**

Fancy. Has fonts, bold, headings, images, and a lot of hidden formatting you cannot see. Built for printing and sharing, not for feeding rules to AI.

**PLAIN TEXT FILE**

Just the words. Nothing hidden inside. What you type is exactly what is stored. This is what we want for rule files.

**WHY PLAIN TEXT FOR AI**

AI only cares about the words. A Word doc hides formatting code around your text that can confuse things. A plain text file has none of that, so AI reads exactly what you wrote and nothing else.

**DO THIS NOW** Open Notepad on Windows or TextEdit on Mac just once, to see how plain it looks. That blank, boring white screen with no toolbar full of buttons is exactly what you want.

THE BIT AFTER THE DOT

# What .md and .txt actually mean

Every file has a name and a small tag at the end, after a dot. That tag is called the extension. It just tells your computer what kind of file this is.

`email_rules` . `md` = name is **email_rules**, extension is **.md**

| | |
|---|---|
| `.txt` | **Plain text.** The most basic file. Works fine for rules. Nothing special needed. |
| `.md` | **Markdown.** Still a plain text file, just labelled as notes or rules. Coding tools and AI apps like this label. |
| `.docx` | **Word document.** Not plain text. Avoid this one for rule files. |

> **The extension is a label, not magic.** A .md file and a .txt file with the same words inside behave almost the same with AI. What is inside matters far more than the tag at the end.

MARKDOWN, PART 1

# Markdown is just text with a few symbols

Markdown sounds technical. It is not. It is plain text where a few simple symbols mark your headings and lists. That is the entire trick. You type the symbols on the left and they organise your text like the right.

WHAT YOU TYPE

```
# Email Rules

## Goal
Write clear, human emails.

## Rules
- Keep it short.
- Sound like a person.
```

HOW AI READS IT

**Email Rules**

**Goal**

Write clear, human emails.

**Rules**

- Keep it short.
- Sound like a person.

**You only ever type the left side.** The symbols keep your rules neat so AI can see the structure: this is the title, these are the rules, this is the avoid list. Clear structure means AI follows it better.

MARKDOWN, PART 2

# The only symbols you actually need

You will use maybe five symbols, ever. Here they are. Learn these and you know enough markdown for rule files for life. No more than this.

| | |
|---|---|
| `# text` | **A big heading.** Use it once at the top for the file title. Example: # Email Rules |
| `## text` | **A section heading.** For each part like Goal, Rules, Things To Avoid. Example: ## Goal |
| `- text` | **A bullet point.** One rule per line. This is the one you will use the most. |
| `1. text` | **A numbered step.** Use when the order matters, like an output format. |
| `**text**` | **Bold.** Wrap a word in two stars to stress it. Fully optional. |

**DO THIS NOW** Do not memorise these. Keep this page open while you write your first file. Hash for headings, dash for bullets. That alone covers about ninety percent of everything you will ever write.

THE HONEST ANSWER

# Do you even need a .md file?

Short answer: not always. This surprises people. AI reads the words, not the file. The file is just a handy place to store those words so you can reuse them without retyping.

**PATH A · JUST PASTE**

Copy your rules straight into the chat before your task. Works in any tool, zero setup. Perfect while you are still figuring out your rules.

**PATH B · SAVE A FILE**

Once your rules are good, save them in a file so you never retype them. Better for daily work and for coding tools that read the file automatically.

**THE MENTAL MODEL**

The rules are the system. The file is just storage. A .md file is not some special AI format. It is only your rules, saved, so future you does not start from zero every time.

> **So if saving a file feels scary right now, skip it.** Paste your rules into the chat and the system already works. You can save it properly later, once you have seen it pay off.

MAKE IT REAL, WINDOWS

# Create your first file on Windows

We will use Notepad, which is already on every Windows PC. There is one trap, and it is the save step. Follow it exactly and you are completely fine.

1. **Open Notepad**
   Search "Notepad" in the Start menu and open it. Blank white screen, no fancy buttons.
2. **Paste your rules**
   Use any rules for now, or copy the starter file from page 16.
3. **File, then Save As**
   Click File in the top left, then Save As.
4. **The important part**
   In the "Save as type" dropdown, choose "All Files". If you skip this, Windows quietly adds .txt and you get email_rules.md.txt by mistake.
5. **Name it and save**
   Type email_rules.md as the name and click Save. Done.

WHAT YOU SHOULD SEE

```
A file named email_rules.md
not email_rules.md.txt

If you see .txt at the end, redo the
save and pick All Files first.
```

MAKE IT REAL, OTHER DEVICES

# Mac, phone, and VS Code

Same idea, different buttons. Pick your device. The tool does not matter. The rules inside the file are what matter.

MAC · TEXTEDIT

Open TextEdit. Click the Format menu, then "Make Plain Text" (this step matters). Paste your rules. Save as email_rules.md.

PHONE · NOTES OR ANY TEXT APP

Keep your rules in a note. Even if your phone cannot save a real .md file, you can copy and paste the rules straight into the AI app. The system still works fully.

VS CODE · BEST FOR CODING TOOLS

New File, paste your rules, Save As email_rules.md. This is the one you use with Claude Code and Cursor, which read the file on their own. More on that in Part 3.

> **On a phone, do not fight the file system.** Keep the rules in a note, copy and paste them into AI before your task. That is a complete, working setup. No real file needed.

FILE FIRST AID

# When the file goes wrong

Three things trip up almost everyone on day one. None of them mean you did anything wrong. Find yours, do the fix, move on.

**My file is called `email_rules.md.txt`**

On save you missed the All Files step. Save again, choose All Files in the type dropdown, and make sure the name ends in .md with no extra .txt after it.

**I cannot see the `.md` at the end**

Your computer hides extensions by default. On Windows, open the folder, go to the View menu, and turn on "File name extensions". Now you can see and fix the name.

**AI is ignoring my rules**

Usually the rules were never actually pasted into the chat, or they are too vague. Make sure the rules are in the chat before your task. For vague versus specific, see page 17.

> **Universal first move.** When the file part is being annoying, just paste your rules straight into the chat and tell AI to follow them. That always works, even before you have saved anything.

PART 02

# Write rules that work

A rule file only helps if AI actually follows it. Here is a simple formula, a ten minute first file, and the difference between rules AI obeys and wishes it quietly ignores.

14 The 6 part formula

15 Each part explained simply

16 Your 10 minute first file

17 Good rules vs bad rules

18 Make AI write the rules

THE FORMULA

# The 6 part formula for any rule file

Use this structure every time you make a new rule file. It keeps your instructions clear and separated, which is exactly what AI needs to follow them well.

the universal structure

```
# [Task Name] Rules

## Goal
What should AI help you do?

## Context
Who is this for? Where will it be used?

## My Style
How should the output sound?

## Rules
What should AI always do?

## Things To Avoid
What should AI never do?

## Output Format
How should the final answer be structured?
```

> **Why this works.** AI follows instructions better when the goal, context, style, rules, avoid list, and format are kept separate. Do not dump everything into one messy paragraph and hope for the best.

PART BY PART

# The 6 parts, explained simply

What each section means and a tiny example for each. Steal these examples and swap in your own words.

**## GOAL**
What you want AI to help with, in one line. *"Write emails that sound human."*

**## CONTEXT**
Who it is for and where it is used. *"For my professor. I am a student."*

**## MY STYLE**
How it should sound. *"Short lines. Simple words. Direct. Not robotic."*

**## RULES**
What AI should always do. *"Give the final version first. Keep it short."*

**## THINGS TO AVOID**
What AI should never do. *"No em dashes. No corporate filler."*

**## OUTPUT FORMAT**
How the answer is laid out. *"Subject, then email, then a shorter version."*

**DO THIS NOW** You do not need all six perfect on day one. Goal, Rules, and Things To Avoid alone will already make AI sound far more like you. Add the rest as you go.

10 MINUTE QUICKSTART

# Build your first rule file now

Do this once and the whole idea clicks. Copy the file on the right, paste it into ChatGPT or Claude, then ask it to rewrite any rough message of yours.

### THE 5 STEPS

- Copy the file on the right.
- Open ChatGPT or Claude.
- Paste the whole file in.
- Write: **follow these rules and rewrite my message,** then paste any rough message.
- If something feels off, add one new rule and run it again.

my_writing_rules.md

```
# My Writing Rules

## My Style
- Simple language
- Short sentences
- Direct, slightly casual
- Not robotic

## Rules
- Give the final version first.
- Keep paragraphs short.
- Sound like a real person.

## Things To Avoid
- No em dashes.
- No fake corporate language.
- Do not over explain.
```

### WHAT YOU SHOULD SEE

A rewrite that is short, easy to read, sounds like a person, and has no em dashes and no "I hope this finds you well". If it still sounds like AI, add the exact thing you did not like as one new rule.

SPECIFIC WINS

# Good rules vs bad rules

AI follows specific instructions far better than vague wishes. "Make it good" means nothing. Replace weak rules with clear ones and watch the output change.

| WEAK RULE | BETTER RULE |
| --- | --- |
| Make it good | **Make the first line clear enough that the reader instantly knows the topic.** |
| Make it human | **Use short sentences and normal words. Avoid corporate phrases.** |
| Make it viral | **Start with a specific problem the viewer has faced, then give a practical fix.** |
| Write better | **Give the final answer first, then explain two improvements in simple words.** |

**The test.** Read your rule and ask: could two different people read this and do the exact same thing? If yes, it is specific enough. If not, it is a wish, not a rule.

LET AI DO IT

# Make AI write the rule file for you

Stuck on what rules to write? Use this prompt. It makes AI interview you first, then build a clean rule file from your answers. Best trick in this whole guide.

copy and paste this

```
I want to create a markdown rule file for this task:
[write your task here]

Ask me 5 questions first so you understand:
1. My goal
2. My style
3. My audience
4. What I want to avoid
5. What output format I need

After I answer, create a clean .md rule file I can reuse
with ChatGPT, Claude, or Claude Code. Keep it simple and
beginner friendly.
```

EXAMPLE TASK TO DROP IN

*"I want to create a markdown rule file for writing cold DMs to potential clients."*

**One catch.** For anything complicated, do not let AI build the file immediately. Make it ask you the questions first. Its questions force you to think clearly, and the file comes out much better.

PART 03

# Use it everywhere

The same rules can be pasted once, saved and reused, or loaded automatically every single time. Here is the full ladder, from manual to hands off, across every major AI tool.

19 The ladder, manual to automatic

20 Paste it, or save and reuse it

21 Make ChatGPT and Claude auto load it

22 Files coding tools read on their own

23 Before vs after, with rules on

THE BIG IDEA

# From paste once to automatic every time

Your rules can live in four places. The words inside stay the same. The only thing that changes is how much effort it takes to use them. Climb the ladder as you get comfortable.

1. **Paste it · manual**
   Copy the rules into the chat each time, before your task. Zero setup. Works in every tool. Start here.
2. **Save and reuse · semi manual**
   Keep an .md file. Paste or upload it when you need it. No more retyping the same rules.
3. **Auto load in the app · hands off**
   Put rules in ChatGPT Custom Instructions or a Project, or a Claude Project or Style. The app loads them on its own.
4. **Auto read from a folder · fully automatic**
   A CLAUDE.md or AGENTS.md file that coding tools read by themselves at the start of every session.

> **Most people live on levels 1 and 2 and that is completely fine.** Levels 3 and 4 are for when a task becomes a daily habit, or when you move into AI coding tools.

LEVELS 1 AND 2

# Paste it, or save it and reuse it

The two simplest levels, and the ones you will use the most. Both take seconds.

**PASTE IT**

Before your task, paste the rules into the chat, then write your request below them. That is it. Works in ChatGPT, Claude, and any other chat.

**UPLOAD IT**

In Claude, attach the .md file and say "follow this file exactly". In ChatGPT, paste it or attach it. Same effect, less scrolling.

universal usage prompt

```
Read email_rules.md first.
Then write an email to my professor asking for an extension.
Follow the file exactly.
Give me the subject line and the final email.
```

**DO THIS NOW** Save your one good rule file somewhere you can find it fast. A pinned note, a folder on your desktop, anywhere. The whole point is to never write those rules from scratch again.

LEVEL 3

# Make ChatGPT and Claude load it on their own

When a task becomes daily, stop pasting. Put your rules where the app reads them automatically before every chat. Set once, forget it.

### CHATGPT

- **Custom Instructions.** In Settings. Runs before every single chat. Best for your overall style.
- **Projects.** A workspace for one job, with its own instructions and files attached.

### CLAUDE

- **Projects.** Add your rules as project instructions or upload the file as project knowledge.
- **Styles.** Save a writing style once and apply it on demand to any chat.

> **Rule of thumb.** A style that should apply to everything you write goes in Custom Instructions. A style for one kind of work, like client emails or captions, goes in a Project or a Style. Keep them separate.

LEVEL 4

# Files coding tools read by themselves

If you start editing or building with AI coding tools, drop a rules file in your project folder and the tool reads it automatically every session. No pasting, ever. This is the top of the ladder.

### CLAUDE.MD

Claude Code and Claude Cowork read this from your project folder at the start of every session. Put your standing rules here once and they apply automatically.

### AGENTS.MD

The cross tool version. Many agents read it, including Codex, Cursor, Copilot, and Gemini. One file, lots of tools. Handy if you switch between them.

### CURSOR

Reads a simple .cursorrules file in your project, or newer .cursor/rules files for bigger setups. Start with the simple one. You can grow later.

> **Keep these short.** A file that loads every single time should only hold rules that apply almost every time. Long, bloated files get half ignored. Tight and focused wins.

PROOF ON ONE PAGE

# What you should see, before and after

Same request, same AI, same person. The only difference is the rule file. This is the entire payoff, side by side.

**WITHOUT RULES**

"I hope this email finds you well. I am writing to kindly request a brief extension on the assignment deadline, as I have been somewhat unwell and would greatly appreciate your understanding in this matter..."

**WITH RULES**

"Hi Professor Sharma, I was unwell this week and need two extra days for the assignment. Can I submit by Friday instead? Thanks, Mudit."

**HOW TO READ THIS**

Same ask. The right one is short, clear, human, and gets read in five seconds. If your "after" still looks like the "before", your rules are too vague or were never pasted. Back to page 17.

PART 04

# Ready made templates

Four rule files you can use today, plus one blank master template. Copy any of these, change a few lines to match your own work, and you are done. No need to start from scratch.

24 Email rules

25 Instagram caption rules

26 Reel editing rules

27 Client message rules

28 The master blank template

TEMPLATE 1

# Email rules

For emails that sound respectful and human, not like an AI template. Great for professors, clients, and work.

email_rules.md

```
# Email Rules

## Goal
Write emails that sound respectful, clear, and human.

## Tone
- Polite and direct
- Not too formal, not too casual

## Rules
- Keep the email short.
- Make the main point quickly.
- End politely.

## Things To Avoid
- No em dashes.
- No "I hope this email finds you well."
- Do not sound like a corporate template.

## Output Format
1. Subject line
2. Final email
3. A slightly shorter version
```

HOW TO USE IT

*"Follow email_rules.md. I need to email my professor for an extension because I was unwell."*

TEMPLATE 2

# Instagram caption rules

For captions that earn saves and follows, not just a few likes and generic comments.

caption_rules.md

```
# Instagram Caption Rules

## Goal
Turn viewers into followers, not just likes.

## Audience
Indian students and creators learning AI practically.

## My Style
- Hinglish, direct, useful
- Slightly personal, no guru tone

## Rules
- First line must give a reason to read on.
- Teach one useful thing inside the caption.
- Add a real tool or example.
- End with a clear reason to follow.

## Things To Avoid
- Do not start with "Save this."
- No generic gyaan, no LinkedIn tone.
- Do not overuse emojis.

## Output Format
1. Best caption    2. Shorter caption
3. Pinned comment  4. 5 hashtags max
```

HOW TO USE IT

*"Follow caption_rules.md. Write a caption for a reel about making your first AI rule file."*

TEMPLATE 3

# Reel editing rules

For editing reels with AI coding agents like Claude Code or Codex. Drop this in your project so the agent edits your way.

reel_editing_rules.md

```
# Reel Editing Rules

## Goal
Edit my reel to feel fast, clear, premium, easy to watch.

## Caption Rules
- Captions around chin height.
- Roman Hinglish only, no Devanagari.
- No black caption boxes.
- Highlight key words in yellow.

## Visual Rules
- Keep my face visible, never cover eyes or mouth.
- Animations should explain what I am saying.
- No childish animation, no random decoration.

## Things To Avoid
- No cheap sound effects, no over animation.
- No captions near the Instagram buttons.

## Output Format
- Render each clip on its own first.
- Do not merge until I approve all clips.
```

HOW TO USE IT

*"Read reel_editing_rules.md first, then edit clip1. Follow the file exactly."*

TEMPLATE 4

# Client message rules

For messaging clients without sounding desperate, confusing, or too salesy. Confident and clear.

client_message_rules.md

```
# Client Message Rules

## Goal
Write client messages that sound confident and clear.

## My Tone
- Respectful, clear, confident
- Not desperate, not too formal

## Rules
- Keep the message short.
- Make the offer clear.
- Explain the next step.

## Things To Avoid
- Do not over explain.
- No fake sales language.
- No big promises without clarity.

## Output Format
1. Main message
2. Short WhatsApp version
3. More professional version
```

HOW TO USE IT

*"Follow client_message_rules.md. Message a gym owner with my app pricing: Rs 2 lakh full, Rs 1 lakh simple, Rs 50k basic."*

YOUR BLANK CANVAS

# The master starter template

Copy this whenever you want to build a new rule file from zero. Fill in the brackets, then delete the brackets. That is the whole job.

starter_template.md

```
# [Task Name] Rules

## Goal
[What you want AI to help with.]

## Context
[Who this is for and where it is used.]

## My Style
- [Style rule 1]
- [Style rule 2]

## Rules
- [What AI should always do]
- [What AI should always do]

## Things To Avoid
- [What AI should never do]
- [What AI should never do]

## Output Format
1. [Output part 1]
2. [Output part 2]
```

DO THIS NOW

Copy this into a file called starter_template.md and keep it forever. Every new rule file you ever make starts as a copy of this. Never stare at a blank page again.

PART 05

# Keep it alive

Your first file will not be perfect, and it does not need to be. This part is about making it a little better every week, until AI feels like it already knows how you work.

29 Turn bad outputs into rules

30 Common mistakes and fixes

31 The beginner checklist

32 The one idea to remember

SLOW AND STEADY

# Turn every bad output into one new rule

Your first file will not be perfect. That is normal. Every bad AI output is actually a gift, because it tells you exactly one rule to add next.

| BAD OUTPUT | RULE TO ADD |
| --- | --- |
| "The email sounds too formal." | **Use normal student language, not corporate language.** |
| "The caption is too generic." | **Add at least 3 specific tools, examples, or steps.** |
| "The edit covers my face." | **Never place graphics over my eyes, nose, or mouth.** |

> **Do not make 50 files on day one.** Start with three: email, captions, and one for your main work. Use them for a week. Add one rule whenever something annoys you. That is how good files are built.

WHEN RULES MISFIRE

# Common mistakes and fixes

When a rule file is not doing its job, it is almost always one of these. Find the symptom, do the fix, run it again.

**AI followed some rules and ignored others**

Your file is too long. Cut it down to the rules that matter most. A long file means AI quietly drops half of it.

**The rules contradict each other**

Like "be detailed" and "keep it very short" in the same file. Pick one. AI cannot obey both and will guess.

**It worked once, then stopped**

You opened a new chat without the rules. Paste them again, or move up to Level 3 so they load on their own.

**The output is still generic or robotic**

Your rules are too vague. Add concrete avoid rules: no em dashes, no "in conclusion", short sentences only. See page 17.

> **Keep it short.** A focused 15 line file beats a messy 60 line file every single time. When in doubt, cut, do not add.

THE LAST CHECK

# The beginner checklist

Before you rely on any rule file, run it past these. If you can tick them all, your file is good enough to start. Good enough is the goal here, not perfect.

- ○ The goal is clear
- ○ The context is clear
- ○ The style is clear
- ○ The rules are specific
- ○ The avoid list is specific
- ○ The output format is written
- ○ The file can be reused
- ○ It is not long for no reason

**DO THIS NOW** Do not chase a perfect file. Tick what you can, use it on one real task, notice the one thing that went wrong, and add one rule for it. That loop is the entire skill.

THE ONE IDEA

# Tools are common. Systems are the edge.

Everyone has ChatGPT now. Everyone can ask random questions. The real advantage is having systems. A rule file is a small system. It saves your style, your rules, and your repeated thinking, so next time you do not start from zero.

REMEMBER THIS

`create once` → `improve slowly` → `use everywhere`

That is how AI stops feeling like a random chatbot and starts feeling personal. Not because the AI changed, but because you finally gave it a system to follow. The same system, every time.

**You now have everything.** The basics, the formula, the templates, and the ways to use them. The only thing left is to make your first real file. Next page.

YOUR NEXT ACTION

# Make one file today

Do not try to build five files. Make one. Call it my_writing_rules.md. Use it on one real message today. Then add one rule after you see the result. That is the entire game.

TINY FIRST ACTION / COPY THIS

```
Follow these rules and rewrite my message in my voice: keep it short, sound human, no em dashes, give the final version first. Here is my message: [paste your rough message]
```

Create once. Improve slowly. Use everywhere.

AI WITH MUDIT

DM "RULES"
